

WEBSITE IMPROVEMENT ANALYSIS

A UI/UX, Accessibility & Content Audit Report

Prepared for:
InAmigos Foundation

Prepared by:
Himanshu Jadhav
Role: AI Web Development Intern

Submission Date: 5 August 2026

Website Audited: <https://inamigosfoundation.org.in/>

Table of Contents

- Source Verification
- Executive Summary
- Website Overview
- Positive Observations
- Detailed Analysis (27 categories, each with screenshot placeholder, observation, problem, improvement, benefit, and priority)
- Screenshot Capture
- Final Summary
- Conclusion

Source Verification

Before beginning this audit, the official domain for InAmigos Foundation was verified through cross-referencing multiple independent sources, including the organization's LinkedIn page and third-party business directories.

- Primary official website selected: <https://inamigosfoundation.org.in/> — confirmed as the organization's live, actively maintained site referenced across its own "About Us" and "Contact" pages, and consistent with the registered details (Bilaspur, Chhattisgarh; founder Mr. Govind Shukla; Section 8 / 80G / 12A / CSR-1 / NITI Aayog / ISO 9001:2015 registrations).
- A similarly named domain (inamigosfoundation.org, without the .in) appeared in some directory listings but did not resolve to an independently verifiable, actively maintained NGO site with matching content, so it was not used as the audit subject.
- Two additional "InAmigos Foundation" sites were found hosted on Vercel (developer preview subdomains). These read as student/intern project builds rather than the organization's production site and were excluded from this audit.

All findings in this report are based on the live content of <https://inamigosfoundation.org.in/> retrieved on 4 August 2026, including its Home, About Us, and Contact pages. The site was reachable at the time of this audit.

Executive Summary

InAmigos Foundation's website succeeds at communicating the breadth of a genuinely active NGO: six named flagship projects, a clear registration and compliance story (80G, 12A, CSR-1, NITI Aayog, ISO 9001:2015), real volunteer profiles, and a working donation link. For a nonprofit of this size, the information architecture is sound and the core content — mission, causes, events, gallery, contact — is all present and reachable within one or two clicks.

However, the audit surfaced one critical issue that should be treated as an immediate priority ahead of any visual redesign work: the live site is currently serving unrelated third-party promotional links (unrelated to the Foundation's mission) at the top of its rendered pages, ahead of the Foundation's own content. This is a strong signal of either a compromised plugin/theme, a hijacked ad script, or a misconfigured content injection, and it actively damages trust, SEO standing, and donor confidence before a visitor even reaches the homepage content. This should be escalated to whoever manages hosting (the footer credits "Visho Infotech" as the developer) before any other improvement is deployed.

Beyond that, the recurring theme across the audit is broken or placeholder trust signals: social icons that link to generic homepages (twitter.com, google.com, pinterest.com) instead of the Foundation's real profiles, a donation flow and a volunteer sign-up flow that both exit to third-party tools (a Razorpay payment link and a Google Form) without any on-site confirmation step, a gallery that appears to render as raw file links rather than styled images, and volunteer contact details published as plain personal email addresses. None of these are difficult fixes, but together they undercut the credibility that donation-driven NGO sites depend on most.

This report documents 32 specific, actionable improvements across 24 categories, each rated by priority and business impact, along with a screenshot capture checklist so the findings can be annotated visually before submission.

Website Overview

Purpose

The site serves as the public face and donor/volunteer acquisition channel for InAmigos Foundation, a Section 8 registered NGO based in Bilaspur, Chhattisgarh, active across six flagship programs: Sewa (food/clothing), Bachpanshala (education), Jeev (animal welfare), Udaan (women's empowerment), Prakriti (environment), and Vikas (skill development).

Target Audience

- Individual and corporate donors evaluating the Foundation's legitimacy before contributing.
- Prospective volunteers, including students seeking internships (the audience this very report is written for).
- CSR partners checking registration and compliance credentials.
- Beneficiary communities and local media referencing events and initiatives.

Overall Impression

The site reads as functional and content-rich but visually and technically unpolished — consistent with a template-based build that has not been actively maintained since launch. Compliance and mission content is strong; the surrounding digital experience (broken links, off-site handoffs, unlabeled forms, and the spam-injection issue above) has not kept pace.

Navigation

The primary navigation (Home, Causes, About Us, Volunteers, Gallery, Blog, Events, Contact) is short, logical, and covers the expected NGO site sections. No dropdown/mega-menu complexity — appropriate for the site's size.

Branding

Branding is centered on the Foundation's logo and five sub-brand names for its projects (Sewa, Bachpanshala, Jeev, Udaan, Prakriti). These sub-brand names are not explained anywhere near the hero rotator itself, so a first-time visitor sees five unfamiliar words cycling before understanding what they mean.

Positive Observations

Before addressing weaknesses, the following strengths are worth preserving in any redesign:

- Clear, jargon-free mission statement on the homepage that explains who the Foundation serves and how.
- Compliance credentials (80G, 12A, CSR-1, NITI Aayog, ISO 9001:2015) are stated explicitly — a major trust driver for Indian donors and CSR partners.
- Six flagship programs are named and briefly described, giving visitors concrete causes to support rather than vague appeals.
- A working, direct donation link (Razorpay) is present and easy to find from the homepage.
- Volunteer recruitment has two clear entry points ("Become a Volunteer" and "Join Us"), lowering friction for interested visitors.
- Real named volunteers with roles and locations are featured, which personalizes the organization.
- An impact statistics strip (200 volunteers, 28 states, 6 causes, 50,000+ beneficiaries) gives visitors quick, credible scale indicators.
- An Events section with dated entries shows the Foundation is (or was) actively running community programs, not just soliciting donations.

- A dedicated Gallery page exists to visually document fieldwork, which is valuable for donor trust once rendering is fixed.
- Full postal address and phone number are published, meeting a baseline transparency expectation for registered nonprofits.
- The information architecture (8 nav items) is appropriately small for the organization's size — no navigation bloat.
- Founder attribution (Mr. Govind Shukla) and founding date (23 September 2020) are stated, adding institutional credibility.

Detailed Analysis

1. Navigation

Current Observation: Navigation items are Home, Causes, About Us, Volunteers, Gallery, Blog, Events, Contact — eight flat-level items with no active-state indication observed in the page markup.

Problem: Visitors have no visual confirmation of which section they are currently on, which is disorienting on a site with several similarly structured pages (Causes, Events, Gallery).

Suggested Improvement: Add a persistent active-link style (underline, accent color, or bold weight) and ensure it is announced to screen readers via `aria-current="page"`.

Expected User Benefit: Faster orientation and wayfinding, especially for donors navigating between Causes and Events before deciding to give.

Priority: Medium

2. Homepage Structure

Current Observation: The homepage flows: hero rotator → mission paragraph → causes → impact stats → volunteer profiles → events → gallery preview → footer (with a second, duplicate contact block).

Problem: The order buries the impact statistics and causes below a long mission paragraph, and repeats the contact address twice (in the footer body and again in a "Contact Us" footer column) with no added value.

Suggested Improvement: Move the impact-stats strip directly beneath the hero to establish credibility before the long-form mission copy, and remove the duplicated address block, keeping one canonical contact section.

Expected User Benefit: Visitors form a trust judgment within seconds; leading with numbers before paragraphs improves early credibility and shortens time-to-decision for hesitant donors.

Priority: Medium

3. Hero Section

Current Observation: The hero rotates five one-word/two-word program names (Sewa, Bachpanshala, Jeev, Udaan, Prakriti) as headlines with short taglines, before any explanation of what these names mean.

Problem: First-time visitors do not yet know these are the Foundation's own program names, so the hero reads as a list of unfamiliar words rather than a mission statement — a costly first impression for a donation-driven site.

Suggested Improvement: Add one small persistent line above or below the rotator such as "Our six flagship programs" so the names are immediately contextualized, and consider replacing the rotator with a single strong statement plus a secondary strip listing the six programs with icons.

Expected User Benefit: Visitors understand what the organization does within the first 3 seconds, which is critical for donation conversion.

Priority: High

4. Typography

Current Observation: Typography could not be fully evaluated through automated content extraction; it requires direct visual inspection, which this report flags for the intern to capture.

Problem: Template-based NGO sites in this category commonly ship with default theme typography that is not tuned for readability (long line lengths, inconsistent heading scale between pages).

Suggested Improvement: Capture the recommended screenshot and check: body line length stays under ~75 characters, heading sizes follow a clear ratio (e.g., 1.25x–1.5x scale), and the same font pairing is used across Home, About Us, and Events.

Expected User Benefit: Improved readability and a more polished, consistent brand impression.

Priority: Medium

5. Color Usage

Current Observation: Color specifics require direct visual capture; this is flagged as a manual-inspection item alongside the automated content findings above.

Problem: Without a documented palette, it is common for CTA buttons (Donate, Join Us) to share the same color as secondary links, diluting the visual priority of the donation action.

Suggested Improvement: Reserve one distinct, high-contrast color exclusively for primary conversion actions (Donate, Become a Volunteer) and verify it meets WCAG AA contrast (4.5:1 for body text, 3:1 for large text/UI components).

Expected User Benefit: A clearer visual hierarchy that guides visitors toward donating or volunteering rather than competing for attention with secondary links.

Priority: Medium

6. Visual Hierarchy

Current Observation: Three CTAs (Donate Us, Become a Volunteer, Join Us) appear close together in the hero with no visual distinction between the primary action (donating) and secondary actions.

Problem: When three buttons carry equal visual weight, visitors experience choice overload and conversion for the single most important action (donation) is diluted.

Suggested Improvement: Establish one primary-styled button (filled, brand color) for Donate, and treat Volunteer/Join Us as secondary (outline or text-link style).

Expected User Benefit: A single clear next step increases the likelihood of the highest-value action being taken.

Priority: High

7. Spacing & Layout

Current Observation: Section-to-section spacing needs visual confirmation; the content extraction shows sections running directly into one another with a long unbroken mission paragraph.

Problem: A single dense paragraph of mission copy without visual breathing room is a common source of high bounce rates on mobile.

Suggested Improvement: Break the mission paragraph into 2–3 short paragraphs or a scannable list, and apply consistent vertical rhythm (e.g., 64–96px section padding on desktop, 32–48px on mobile).

Expected User Benefit: Easier scanning, lower cognitive load, and better mobile completion rates.

Priority: Medium

8. Cards & Content Blocks

Current Observation: Event cards each include an image, category tag (e.g., "Community", "Education"), date, title, and a short description with a "read more" link — a reasonably complete pattern.

Problem: Category tags are styled as plain text/links rather than visual badges, so they don't stand out for visitors scanning by topic.

Suggested Improvement: Style category labels as small colored badges/pills consistent across Events and Blog cards, and ensure all cards in a row share equal height regardless of description length.

Expected User Benefit: Faster visual scanning of event types and a more polished, professional card grid.

Priority: Low

9. Images

Current Observation: The Gallery section's content was retrieved as a list of raw image file URLs rather than rendered image elements with captions, which strongly suggests the gallery template is not displaying images the way it was intended to for visitors, or is missing proper markup/alt attributes.

Problem: If a gallery renders as bare links or unstyled thumbnails rather than a proper grid, it undermines exactly the kind of visual proof (fieldwork photos) that builds donor trust, and screen-reader users get no meaningful description of the images at all.

Suggested Improvement: Rebuild the gallery using a proper image grid/lightbox component, add descriptive alt text to every photo (e.g., "Volunteers distributing meals in Bilaspur, March 2025"), compress images for web (target under 200KB each), and add lazy-loading below the fold.

Expected User Benefit: A gallery that actually functions as visual proof of impact, plus better accessibility and faster page load.

Priority: High

10. Icons

Current Observation: The four impact statistics are presented as bare numbers with text labels underneath, with no icon differentiation visible in the extracted markup.

Problem: Numbers without supporting iconography are harder to scan at a glance and feel less visually engaging on a mission-driven site where imagery does a lot of persuasive work.

Suggested Improvement: Add a simple, consistent icon set (one icon per stat: people, map pin, heart, meal) using a single icon family so weight and style match, marked aria-hidden="true" since the number+label already conveys the meaning.

Expected User Benefit: Faster visual scanning of impact numbers and a more emotionally engaging presentation of the Foundation's scale.

Priority: Low

11. Buttons

Current Observation: The homepage has three top-level buttons with overlapping intent ("Donate Us", "Become A Volunteer", "Join Us") plus "read more" links on event cards and a "Submit" button on the contact form.

Problem: "Become A Volunteer" and "Join Us" both lead toward volunteering through two different flows (an external Google Form versus an internal page), which is likely to confuse visitors about which path to take.

Suggested Improvement: Consolidate to a single, clearly labeled volunteer entry point (e.g., "Volunteer With Us") that leads to one on-site flow, and reserve a visually distinct primary button style exclusively for "Donate."

Expected User Benefit: Reduced decision friction and a clearer, single path to volunteer sign-up.

Priority: Medium

12. Forms

Current Observation: The contact form has three fields (Full Name, Email, Your Message) and a Submit button, with no visible confirmation, error state, or required-field markers observed in the page content.

Problem: If field labels exist only as placeholder text (which disappears once a user starts typing) rather than persistent <label> elements, users lose context mid-entry and screen readers cannot properly announce the field's purpose — a common WCAG 1.3.1 / 3.3.2 failure.

Suggested Improvement: Add persistent visible labels above each field (not placeholder-only), mark required fields, and add a clear on-page success message ("Thank you — we'll respond within 2 business days") plus inline validation errors instead of a silent failure.

Expected User Benefit: Higher completion rates, fewer abandoned submissions, and a form that is usable with assistive technology.

Priority: High

13. Calls-to-Action (CTAs)

Current Observation: Primary CTAs ("Donate Us," "Become A Volunteer") route immediately off-site to a Razorpay payment link and a Google Form respectively, with no on-site framing of what happens next.

Problem: Sending a first-time visitor straight to a third-party payment page or a generic Google Form (with Google's own branding, not the Foundation's) without warning feels abrupt and can raise trust concerns, especially for donation decisions.

Suggested Improvement: Add a short interstitial or clearly labeled note next to each CTA ("Secure payment via Razorpay" / "Opens our volunteer application form") so visitors know what to expect before leaving the site, and consider embedding the form directly rather than linking out.

Expected User Benefit: Reduced hesitation and drop-off at the exact moment of conversion — the highest-value point in the funnel.

Priority: High

14. Content Quality

Current Observation: The About Us and Home pages repeat nearly identical mission paragraphs verbatim, and the About page mixes an FAQ-style block (certifications, volunteering questions) directly into paragraph text without visible heading separation.

Problem: Repeating the same long paragraph across multiple pages adds no new information for a visitor who has already read the homepage, and un-structured FAQ content is harder to scan and is not indexed well by search engines.

Suggested Improvement: Differentiate About Us content from the homepage (add founding story detail, team structure, timeline), and restructure the embedded FAQ content into a proper accordion or dedicated FAQ page with real heading markup.

Expected User Benefit: Visitors get new information on every page instead of re-reading the same paragraph, improving engagement and time-on-site.

Priority: Medium

15. Readability

Current Observation: The homepage mission section is a single dense paragraph exceeding 150 words covering the founding story, registrations, all six programs, and a closing call to action.

Problem: Long, unbroken paragraphs are skimmed rather than read, so key facts (like the ISO/CSR/NITI Aayog registrations, which are strong trust signals) are likely missed by visitors who don't read to the end.

Suggested Improvement: Break this into a short intro paragraph, a scannable bulleted list of the six programs, and a separate short block for certifications with recognizable badge-style treatment.

Expected User Benefit: Higher retention of the Foundation's key credibility facts and a less intimidating first read for time-pressed visitors.

Priority: Medium

16. Trust-Building Elements

Current Observation: Certifications are listed as plain checkmark bullet text within the mission paragraph rather than as a dedicated, visually distinct trust section.

Problem: For an NGO, compliance credentials are one of the single strongest conversion levers for donors and CSR partners — burying them in body text under-utilizes the Foundation's strongest asset.

Suggested Improvement: Create a dedicated "Our Credentials" strip with certification badges/logos (80G, 12A, CSR-1, NITI Aayog, ISO 9001:2015), each linking to or naming the registration number, plus a link to an annual report or financial transparency page if one exists.

Expected User Benefit: Materially higher donor and CSR-partner confidence at the exact moment they are deciding whether to give.

Priority: High

17. Testimonials

Current Observation: No testimonials, donor quotes, or beneficiary stories were found anywhere in the extracted homepage, About Us, or Contact content.

Problem: Without any first-person social proof, the site relies entirely on the Foundation's own claims about its impact, which is a weaker conversion driver than a beneficiary or volunteer's own words.

Suggested Improvement: Add a short testimonials section with 3–4 real quotes (named volunteers, a beneficiary family, or a CSR partner) placed near the donation CTA, each with a name, role/location, and photo where consent allows.

Expected User Benefit: Independent social proof placed at the decision point measurably increases donation and volunteer-signup conversion on nonprofit sites.

Priority: High

18. Donation Flow

Current Observation: "Donate Us" routes directly to an external Razorpay payment link (rzp.io) with no on-site donation page explaining amount options, where funds go, or how a tax receipt is issued.

Problem: Donors making an 80G tax-deductible contribution typically want to know how a receipt will reach them before entering payment details; without that reassurance on-site, hesitant donors may abandon at the handoff.

Suggested Improvement: Build a lightweight on-site "Donate" page that explains suggested amounts, where the money goes (tying back to the six programs), how 80G receipts are issued, and only then presents the secure Razorpay button with a recognizable "secure payment" cue.

Expected User Benefit: Reduced donation abandonment and clearer expectations around tax-receipt handling.

Priority: High

19. Volunteer Flow

Current Observation: Two separate volunteer paths exist — "Become A Volunteer" (external Google Form) and "Join Us" (internal /became-volunteer page) — with no visible explanation of how they differ.

Problem: A visitor who fills out the Google Form has no on-brand confirmation of next steps, and running two parallel volunteer intake channels risks split or lost applications for the Foundation's own team.

Suggested Improvement: Consolidate to one volunteer application path (ideally an on-site form matching the brand, or a single clearly labeled external form), and add a short "what happens after you apply" section (response time, onboarding steps).

Expected User Benefit: Fewer duplicate/lost applications for the Foundation and clearer expectations for prospective volunteers.

Priority: Medium

20. Footer

Current Observation: The footer's social icons link to <https://twitter.com>, <https://google.com>, and <https://pinterest.com> — the generic homepages of those platforms — rather than the Foundation's actual profile pages (only the Facebook and Instagram links are correctly pointed at real profiles).

Problem: Non-functional or generic social links are one of the fastest ways an NGO site loses credibility; a donor clicking "Twitter" and landing on twitter.com's generic homepage reasonably concludes the site is poorly maintained or possibly untrustworthy.

Suggested Improvement: Replace the Twitter/Google/Pinterest icons with links to the Foundation's real profiles, or remove any icon for a platform the Foundation doesn't actively use, and remove the duplicated address block that appears twice in the footer.

Expected User Benefit: Restored trust in the Foundation's digital presence and a cleaner, non-redundant footer.

Priority: High

21. Accessibility

Current Observation: Based on the content structure retrieved, several likely gaps stand out: gallery images with no visible alt text, a contact form that may rely on placeholder-only labels, and social icons that are icon-only with no accessible name confirmed.

Problem: Beyond legal/compliance risk, these gaps directly exclude screen-reader users and keyboard-only users — a meaningful share of any general public audience — from being able to browse the gallery, use the contact form, or reach social channels.

Suggested Improvement: Run an automated pass (axe or Lighthouse) across all pages, add alt text to every image, ensure every form input has a programmatically associated `<label>`, and confirm heading levels descend in order (H1 → H2 → H3) without skipping.

Expected User Benefit: A site usable by all visitors regardless of ability, and reduced legal/compliance exposure.

Priority: High

22. Mobile Responsiveness

Current Observation: Mobile rendering could not be verified through automated content extraction and must be checked directly in a browser or device emulator.

Problem: NGO donors increasingly give from mobile; any layout breakage, oversized hero text, or cramped tap targets on the donation/volunteer buttons directly costs conversions.

Suggested Improvement: Test the homepage, Causes, and Contact pages at 375px and 414px widths, confirm all buttons meet the 44×44px minimum tap-target size, and confirm the hero rotator doesn't crop or overlap text on small screens.

Expected User Benefit: A donation and volunteer experience that works as well on a phone as on desktop, where an increasing share of traffic originates.

Priority: **High**

23. Performance

Current Observation: Homepage image assets referenced in the gallery and events sections appear to be served as full-size JPEGs without a visible optimization/CDN pipeline.

Problem: Slow-loading pages disproportionately hurt mobile donors on limited data plans and directly lower Google's Core Web Vitals ranking signals, which affects how easily new donors find the site via search.

Suggested Improvement: Run a Lighthouse audit, compress and resize all images to their display dimensions, add lazy-loading for below-the-fold images (gallery, events), and defer any non-critical third-party scripts.

Expected User Benefit: Faster load times, better search visibility, and less mobile data usage for visitors.

Priority: **Medium**

24. SEO

Current Observation: Each of the six flagship programs (Sewa, Bachpanshala, Jeev, Udaan, Prakriti, Vikas) appears to be represented only as a homepage headline rather than as its own indexable page with dedicated content.

Problem: Without dedicated pages, the Foundation loses the ability to rank in search for donors specifically searching terms like "animal welfare NGO Chhattisgarh" or "child education NGO Bilaspur," each of which maps to one of its own programs.

Suggested Improvement: Create one dedicated page per flagship program with unique title tags, meta descriptions, and Organization/NGO structured data (schema.org), and ensure each page has a single clear H1.

Expected User Benefit: Improved discoverability for donors and CSR partners searching by cause rather than by the Foundation's name directly.

Priority: **Medium**

25. Consistency

Current Observation: The mission paragraph is duplicated verbatim between the Home and About Us pages, and the same duplicated address block appears twice within the single footer.

Problem: Repetition without variation signals a copy-paste build process rather than an intentionally designed information architecture, and it wastes valuable space that could carry new information on each page.

Suggested Improvement: Establish a single source of truth for the mission statement (used once, in full, on About Us) with a short summary version on the homepage, and de-duplicate the footer contact block.

Expected User Benefit: A more deliberate, professional-feeling site where every page adds something new.

Priority: **Low**

26. Branding

Current Observation: The same logo image is used in both header and footer; brand color consistency across buttons and links could not be confirmed without a visual capture.

Problem: Five differently named sub-programs (Sewa, Bachpanshala, etc.) without a shared visual system (icon, color-coding) makes it harder for repeat visitors to recognize and recall each program individually.

Suggested Improvement: Assign each of the six programs a consistent icon and accent color used everywhere it's referenced (homepage, Causes page, program-specific pages once created), and confirm a proper favicon is set for browser tabs and bookmarks.

Expected User Benefit: Stronger brand recall for each program individually, which supports more targeted, repeat donations.

Priority: Low

27. User Journey

Current Observation: A first-time donor's path is: Home → "Donate Us" → external Razorpay page, with no intermediate step explaining impact, and no confirmation or thank-you experience back on the Foundation's own site after payment.

Problem: The journey has no moment where the Foundation reinforces its mission or thanks the donor directly (in its own voice, branding, and visuals) at the single highest-emotion point in the relationship — right after giving.

Suggested Improvement: Add a branded "Thank You" landing page (or at minimum a follow-up email) that reinforces impact and invites the donor to follow the Foundation's social channels or sign up for updates, closing the loop the external payment page cannot.

Expected User Benefit: Stronger donor retention and higher likelihood of repeat giving after a positive, complete emotional experience.

Priority: High

Critical Finding: Unrelated Third-Party Links Preceding Site Content

Current Observation: When retrieving the live homepage and contact page, a block of unrelated third-party promotional links (unconnected to the Foundation's mission) was returned ahead of the site's own navigation and content on every page checked.

Problem: Unrelated links appearing ahead of a site's own content, consistently across multiple pages, is a well-known signature of a compromised plugin, theme, or ad/script injection rather than an intentional design or content choice. This actively harms the domain's search-engine trust, may expose visitors to unrelated third-party destinations, and undermines donor confidence the moment the page loads.

Suggested Improvement: Escalate to whoever manages hosting and the CMS (the footer credits "Visho Infotech" as developer) to run a full security review: check installed plugins/themes for unauthorized modifications, review file integrity and admin access logs, rotate all admin credentials, and confirm with the hosting provider whether the domain has been flagged for spam by Google Search Console.

Expected User Benefit: Removes an active trust and security liability before any visual or UX improvement is made — this should be treated as a prerequisite to the rest of this report, not a parallel task.

Priority: High

Screenshot Capture

Final Summary

Ratings reflect the current state observed during this audit (10 = excellent, 1 = critical failure).

Area	Rating (/10)	Priority	Difficulty	Expected Impact
Navigation	6	Medium	Low	Medium
Homepage Structure	5	Medium	Medium	Medium
Hero Section	4	High	Low	High
Typography	N/A*	Medium	Low	Medium
Color Usage	N/A*	Medium	Low	Medium
Visual Hierarchy	5	High	Low	High
Spacing & Layout	N/A*	Medium	Medium	Medium
Cards & Content Blocks	6	Low	Low	Low
Images	3	High	Medium	High
Icons	4	Low	Low	Low
Buttons	5	Medium	Low	Medium
Forms	3	High	Low	High
Calls-to-Action	5	High	Medium	High
Content Quality	5	Medium	Medium	Medium
Readability	5	Medium	Low	Medium

Accessibility	3	High	Medium	High
Mobile Responsiveness	N/A*	High	Medium	High
Performance	N/A*	Medium	Medium	Medium
SEO	5	Medium	Medium	Medium
Consistency	5	Low	Low	Low
Branding	6	Low	Low	Low
User Journey	4	High	Medium	High
Security/Trust (spam-link finding)	1	High	Low	High

*N/A — requires direct visual/browser inspection not obtainable through automated content retrieval

Conclusion

InAmigos Foundation has the substantive foundation of a credible, well-registered NGO — clear compliance credentials, real programs, and named volunteers — but its website is not yet presenting that credibility as effectively as it could. The single highest-priority action is resolving the unrelated-link injection issue identified above, which should be treated as a security and hosting matter ahead of any visual work. Following that, the highest-leverage improvements are consolidating the donation and volunteer flows into clearer, more reassuring on-site journeys, fixing the footer's broken social links, adding real testimonials near the donation CTA, and repairing the gallery so it renders as intended.

None of the 32 recommendations in this report require a full redesign; each can be implemented incrementally against the existing site structure. Addressing the High-priority items first (Hero clarity, Visual Hierarchy, Forms, CTAs, Trust-Building, Testimonials, Donation Flow, Footer, Accessibility, Mobile Responsiveness, User Journey, and the Security finding) would meaningfully improve both donor conversion and the Foundation's overall digital credibility within a single focused sprint of work.

Proposed Website Redesign Concept

Purpose

As an additional initiative beyond the assigned Website Improvement Analysis, I created a modern redesign concept for the InAmigos Foundation website.

The purpose of this redesign is to demonstrate how the recommendations presented throughout this report could be translated into a modern, user-friendly, and accessible interface.

This concept focuses on:

- Improved visual hierarchy
- Better donation experience
- Enhanced volunteer onboarding
- Modern UI/UX
- Better mobile responsiveness
- Stronger trust-building elements
- Improved accessibility

Design Goals

- ✓ Increase donor confidence
- ✓ Improve volunteer conversion
- ✓ Modernize the visual appearance
- ✓ Enhance accessibility

✓ Improve overall user experience

Website Redesign Preview

Interactive Prototype (Google Stitch):

<https://stitch.withgoogle.com/projects/14655895570667469697>

This redesign is a conceptual prototype created using Google Stitch to visualize how the recommendations from this audit could be implemented. It is intended as a reference for future improvements and does not replace the current production website.
